Step 1: Find the Suspect

A band of jewel thieves is on the run in five cities across the world. We need your help finding them. On March 31, 2012, we'll release their pictures to the public. Be on the lookout.

Time-Critical Social Mobilization

Galen Pickard,^{1,2*} Wei Pan,^{1*} Iyad Rahwan,^{1,3*} Manuel Cebrian,^{1*} Riley Crane,¹ Anmol Madan,¹ Alex Pentland^{1†}

The World Wide Web is commonly seen as a platform that can harness the collective abilities of large numbers of people to accomplish tasks with unprecedented speed, accuracy, and scale. To explore the Web's ability for social mobilization, the Defense Advanced Research Projects Agency (DARPA) held the DARPA Network Challenge, in which competing teams were asked to locate 10 red weather balloons placed at locations around the continental United States. Using a recursive incentive mechanism that both spread information about the task and incentivized individuals to act, our team was able to find all 10 balloons in less than 9 hours, thus winning the Challenge. We analyzed the theoretical and practical properties of this mechanism and compared it with other approaches.

Fig. 1. (A) Distribution of tree depth on a log-log scale with a power law fit. (B) Distribution of tree size on a log-log scale with a power law fit. (C) Distribution of the branching factor on a log-log scale with a power law fit.

Fig. 2. (A) Number of people recruited over time up to the winner announcement. The dotted line indicates the time the balloons were launched into their positions by DARPA. (B) Cumulative number of people recruited over time. (C) Complementary cumulative distribution of the inter-signup time on a semi-log scale with an exponential fit. Shown is a larger-than-exponential drop off at the end of the graph, which is due to the time-critical nature of the task.

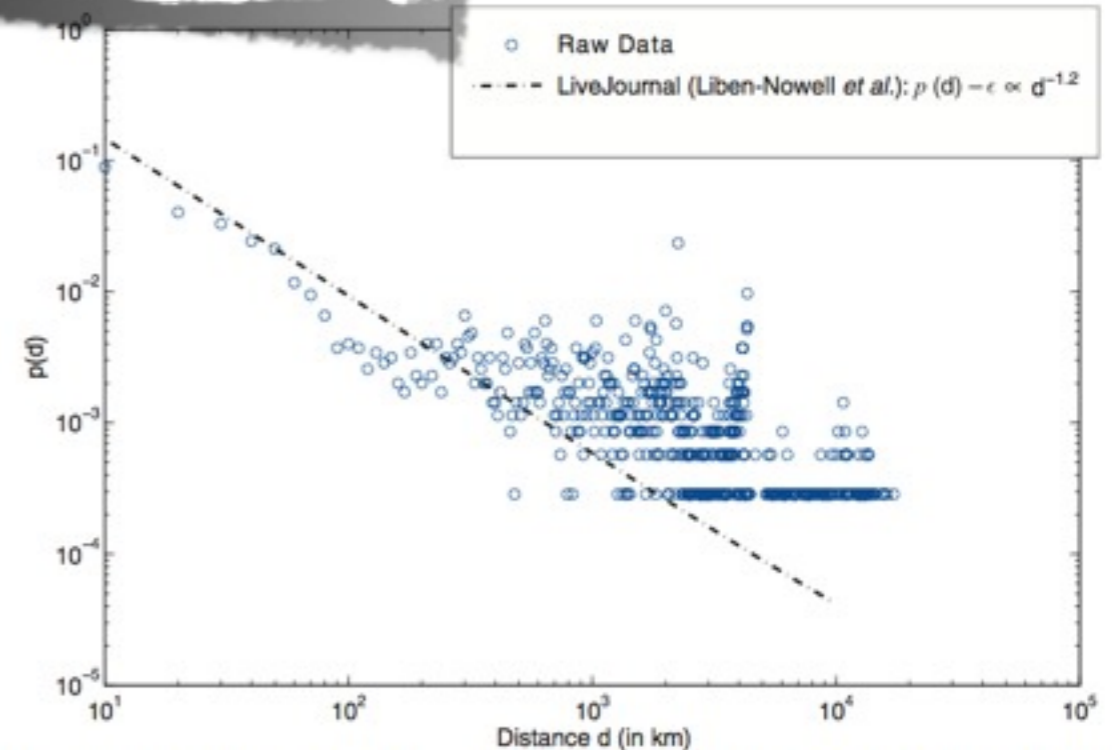

Fig. 3. Distribution of distance between recruiter nodes and their recruits. The dotted line shows the best-fit rank-based friendship model by Liben-Nowell *et al.* (30). We apply the same treatment to our data points as in Liben-Nowell *et al.* by rounding distances to multiples of 10 km. Approximate geographic locations were discovered from users' Internet provider addresses during sign-up.

Limits of social mobilization

linear investment in any arbitrary
 Galton-Watson process with $b > 1$

THEOREM 15 (Efficiency). Consider any Galton-Watson branching process with $b > 1$. Then, at equilibrium, the root retrieves the answer with probability at least $\sigma = 1 - \zeta$ provided an investment of

$$r^* = \frac{4}{\epsilon} \cdot \max \left\{ \frac{1}{b-1}, \frac{1}{\epsilon} \cdot \frac{1}{1 - \Psi'(\zeta)} \right\} \cdot h_{\Psi}(\epsilon, n).$$

In the case of a ray, with $b = 1$ and $c_0 = \zeta = 0$, an investment of $r^* = 4 \cdot \frac{n}{\epsilon^2} \cdot h_{\Psi}(\epsilon, n) = 4 \cdot \frac{n^2}{\epsilon^2} \ln \frac{1}{\epsilon}$ suffices.

If root chooses to pass reward to node d, then b receives $5 - 2 = 3$. d receives 2. root payoff is $9 - 5 = 4$.

Kleinberg-Raghavan
polynomial investment
 with $b < 2$

Finding 10 balloons across the U.S. illustrates how the Internet has changed the way we solve highly distributed problems.

BY JOHN C. TANG, MANUEL CEBRIAN, NICKLAUS A. GIACOBÉ, HYUN-WOO KIM, TAEMIE KIM, AND DOUGLAS "BEAKER" WICKERT

someone else's balloon

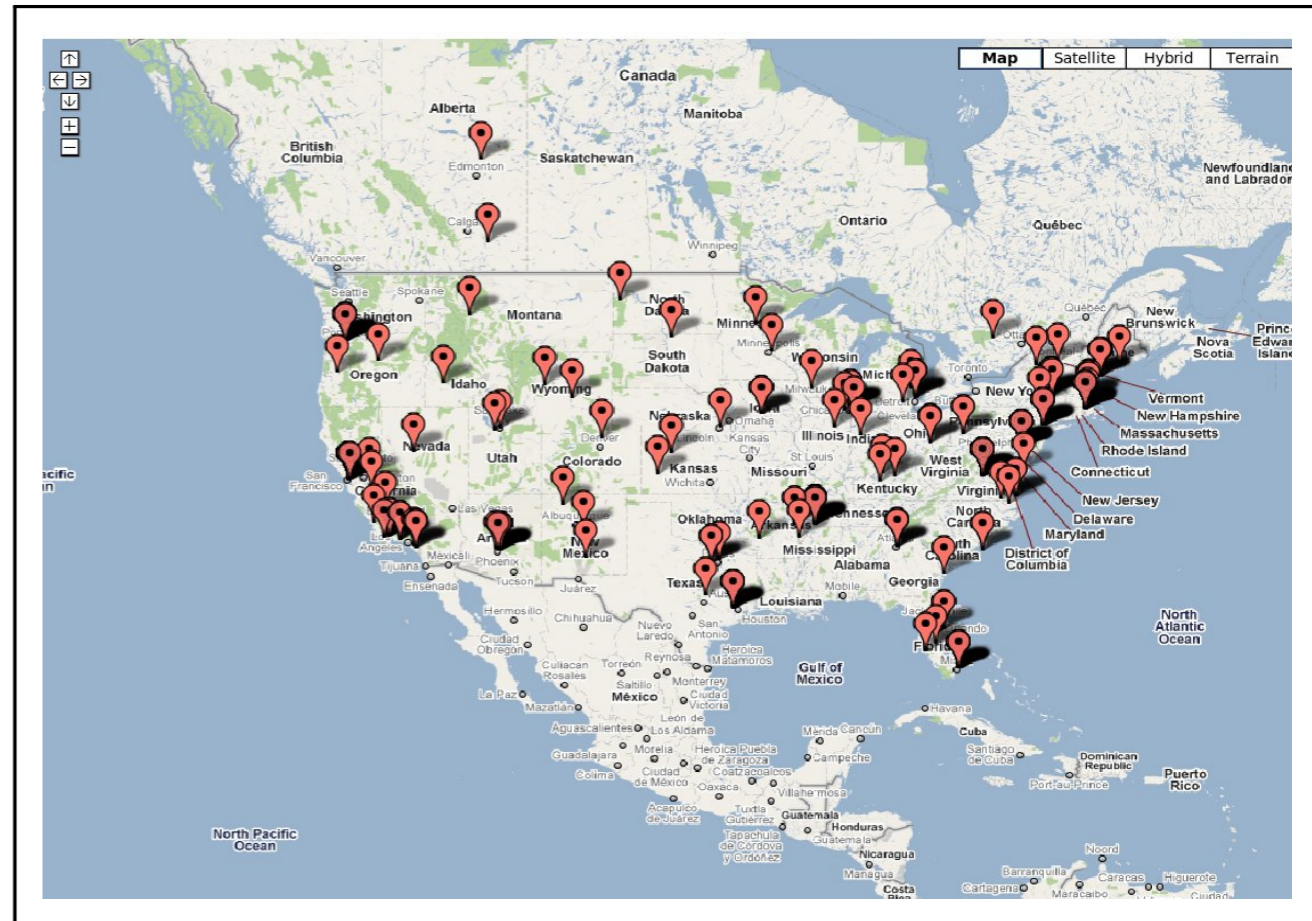

Darpa red balloon challenge going on... a friend of mine in Boulder sent this pic to me... wow, hope they win!

We had a good time romping about and sending balloons up in Cambridge, Belmont, Somerville and some other places. We didn't have time to stick around and pretend to be DARPA employees, but once back home, we uploaded some photos from iphones with hacked exif data to modify the GPS coordinates.

Crowdsourcing contest ends with partial victory for MIT team

*Simulated person search sheds light on reach of social media;
Winning team locates "suspects" in three out of five cities in a single day.*

Washington, D.C. – The 2012 TAG Challenge drew competition from teams across North America, Europe, and the Middle East, as participants organized online in an effort to locate five fictitious “jewel thieves” in the U.S. and Europe.

The best performing team, the MIT-affiliated CrowdScanner, found suspects in Bratislava, Washington DC, and New York City, and submitted their photographs to the contest website by 7:17pm EST, 17 hours after the contest began.

Official Website: www.tag-challenge.com

The screenshot shows the TAG Challenge website interface. At the top, there is a navigation bar with the TAG CHALLENGE logo, a mobile phone icon, and links for Suspects, About the Contest, News & Updates, and an Upload Photos button. The main content area features a large blue banner for 'Step 3: Upload the Image'. This banner includes an illustration of a person at a computer, the text 'Collaborate online with friends or teammates to find all five suspects and take a picture of each. Submit the photos to this site when you have all five.', and a prominent orange 'Play TAG' button. Below the banner is a progress bar with four steps: 1. Find the Suspect, 2. Photograph the Suspect, 3. Upload the Image (which is highlighted), and 4. Win \$5000!. Below the progress bar, there is a social media update from Twitter and Facebook. The Twitter update says 'Happy to officially announce the challenge winner. Team CrowdScanner. 3 outta 5 ain't bad. Check out the press release: http://t.co/QIGACE41'. The Facebook update says 'Whitney Camp Picard, Graham Jenkins and 333 others like this.' Below the social media updates is a news article titled 'Jewel thieves have stolen a prized diamond. Help find them. Win \$5,000.' The article text reads: 'The infamous Panther Five has pulled an audacious new heist: they've stolen the world's 3rd most expensive jewel, the Adly Diamond, from the Overholt Showroom in Washington, DC. Now they've split up and fled—dispersed to five different cities. We're offering a reward to help find them. We'll release their mugshots here on game day: March 31, 2012.' At the bottom of the page, there is a section with a question mark icon and the text 'Get ready to Play TAG'.

THIS DOESN'T
MAKE SENSE!
Julius Caesar?
Despite being captured by 10 pirates, Caesar
brought 23 changes to Rome before being awarded
with the title Consul. A master of war, he
captured the 8 Gallic tribes and fully documented
his 24 exploits in a book titled "Commentarii
de Bella Gallica." In this novel he describes
the creation of the first encryption method used
to protect correspondence. After the creation
of the First Triumvirate in 1866, he was
awarded the role of dictator for life, started
21 civil wars, and was murdered by as
many friends as enemies.

subject UCSD Shredder Challenge Sabotage

«I appreciate your acknowledging the cleverness of my exploitation of the weaknesses in your shredder challenge puzzle solving implementation.»

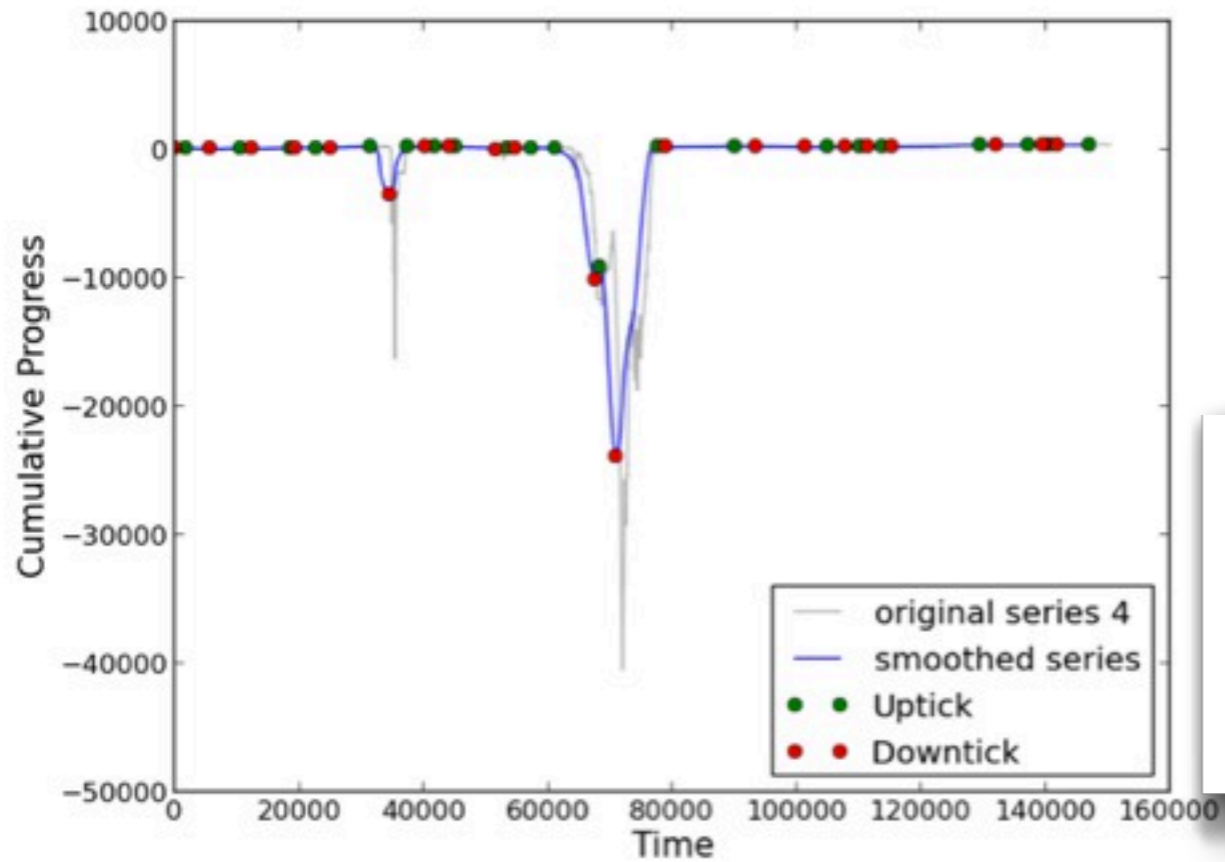

«For my first attack, everything was wide open. I made a post to 4chan to recruit people instructing them to disconnect any connected pieces and then start moving all the pieces into a single pile [...] However, it seemed all you did was lock the pieces together and ban my IP address.»

«Which led me to my second attack, using a VPN and a neighbors wireless for some new IP addresses, it was still very easy to just select all the pieces and place them on top of each other, but this got old soon and was too easily spotted by the puzzle solvers.»

«So I decided to get a bit more sneaky when I realized your implementation didn't have any check on the bounds of the virtual table when moving pieces. I selected a number of pieces, enough to make solving the puzzle difficult with the missing pieces and not so much that people would immediately notice, and then just moved them off the top of the virtual table.»

«Anyways...I thoroughly enjoyed myself, and hope you all learned something about crowd sourcing and will give a bit more thought to security when considering your next implementation. Whatever and when ever that may be. »

«As for my motivation, I too am working on the puzzle and personally feel that crowd sourcing is basically cheating (and I'm not the only one that feels this way). Sure, if you get enough people together and working on it they will be able to solve nearly any puzzle. It's only a matter of time, however for what should be a programming challenge about computer vision algorithms, crowd sourcing really just seems like a brute force and ugly plan of attack, even if it is effective.»

Step 1: Find the Suspect

A band of jewel thieves is on the run in five cities across the world. We need your help finding them. On March 31, 2012, we'll release their pictures to the public. Be on the lookout.

DARPA Network Challenge:

4 years, 4 lessons

I. Hierarchical, incentive-based mobilization can be **fast, large, cheap**.

II. Exhibits large **variability** (you have to be lucky, or try many times).

III. Can be made **robust to misinformation**, but **not sabotage**.

IV. **Sabotage** is the expected behavior.

Urban characteristics attributable to density-driven tie formation

Wei Pan¹, Gourab Ghoshal^{1,†}, Coco Krumme¹, Manuel Cebrian^{1,2,3} & Alex Pentland¹

Motivated by empirical evidence on the interplay between geography, population density and societal interaction, we propose a generative process for the evolution of social structure in cities. Our analytical and simulation results predict both super-linear scaling of social-tie density and information contagion as a function of the population. Here we demonstrate that our model provides a robust and accurate fit for the dependency of city characteristics with city-size, ranging from individual-level dyadic interactions (number of acquaintances, volume of communication) to population level variables (contagious disease rates, patenting activity, economic productivity and crime) without the need to appeal to heterogeneity, modularity, specialization or hierarchy.

Why do cities *super-scale*?

Why do only cities *super-scale*?
