

# Social networks module

J.Hackney IVT/ETH

MATSim User Meeting 23.04.2009

TU Berlin

# Social Nets in MATSim

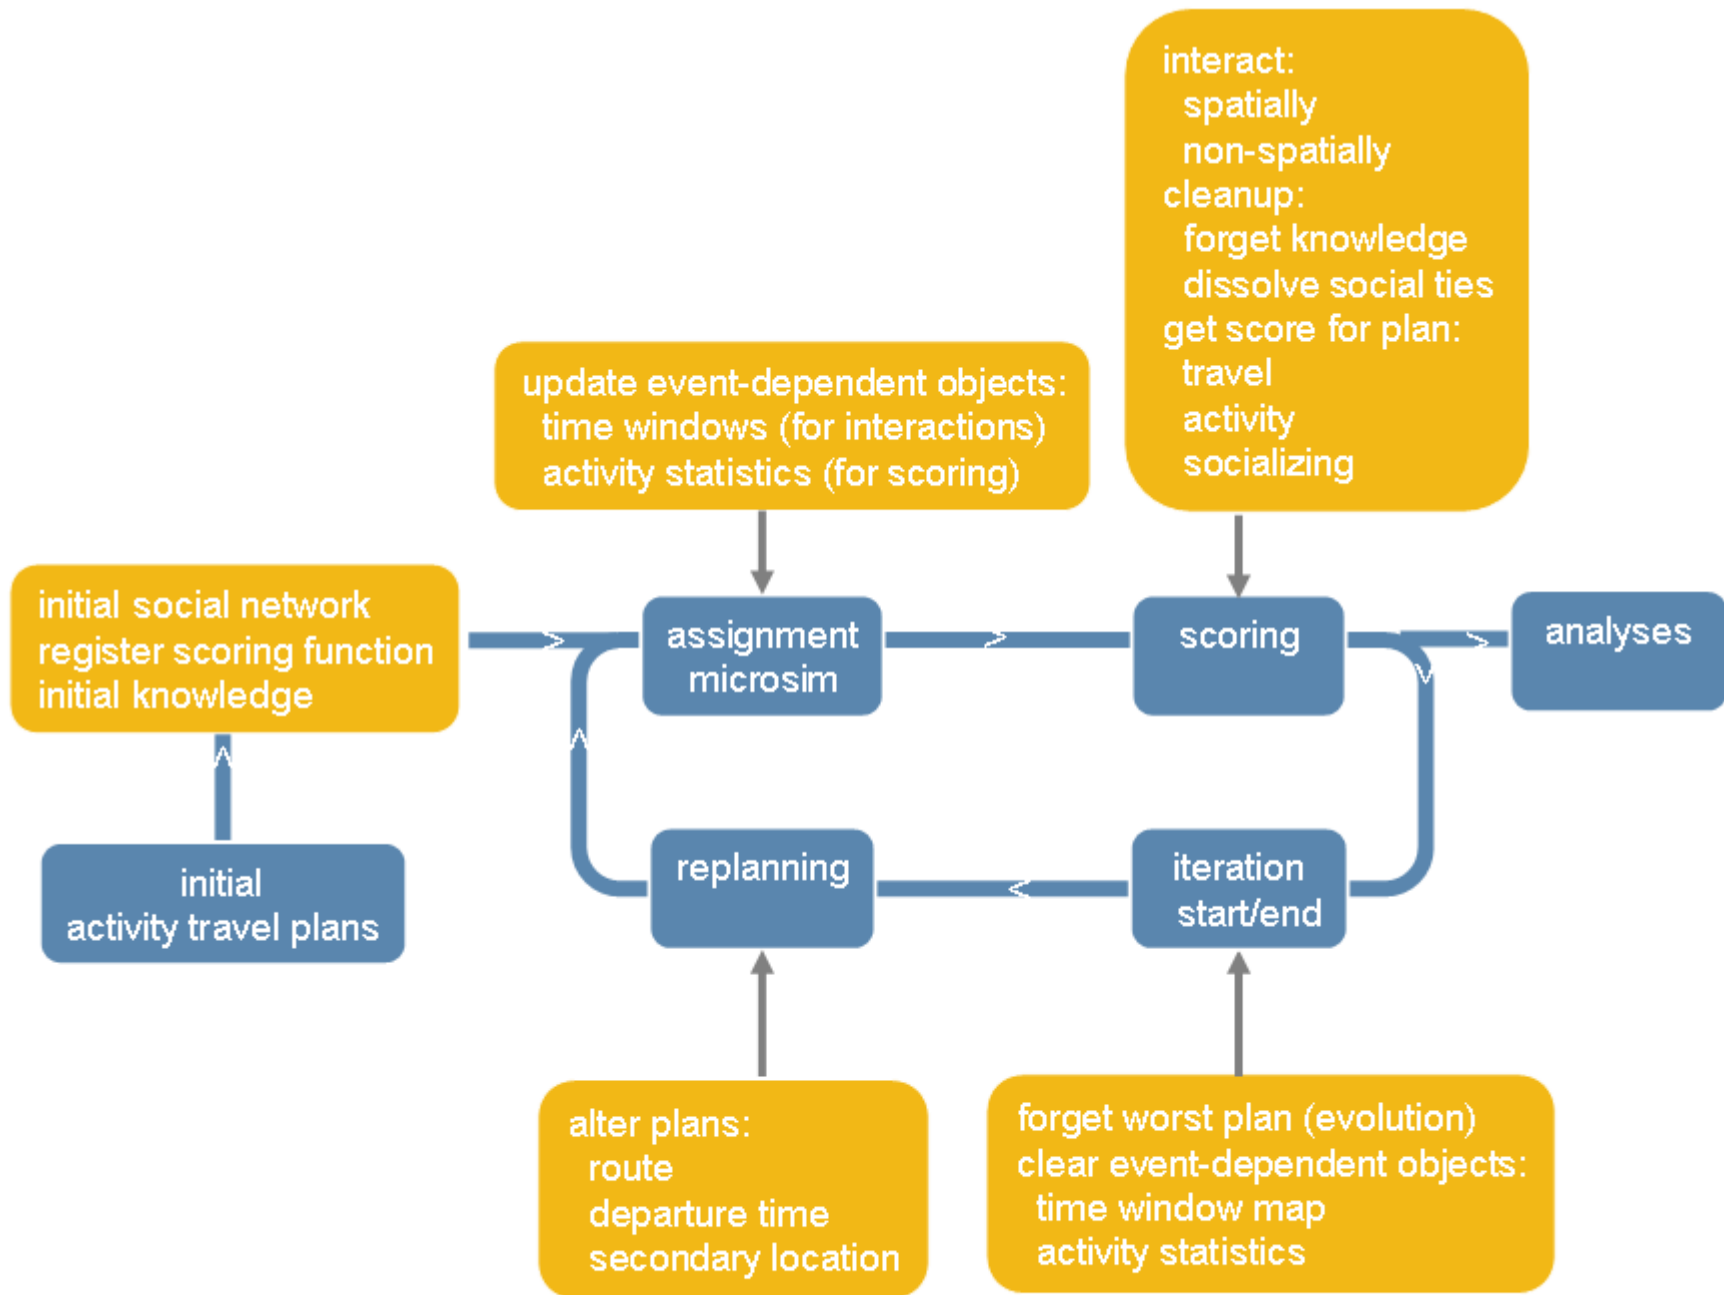

- ... Created or evolving with activity travel
- ... Used as a substrate for generating joint activity travel

# MATSim vs. Behavior Model

- Result vs. Process
- MATSim is a search algorithm
  - Random changes to plans and culling worst individuals
  - "Optimality" surface changes with feedback
  - "Strategy" == dimension in which to search utility space
    - Time/duration
    - Route
    - Location
- "Behavior": decision-making
  - "Strategy" may include risk perception and management, various time horizons
  - Constrained information and uncertainty about information
  - Reinforcement, habits
  - Learning (targeted search in solution space)

# Conflicting model goals

- MATSim agents do not experience time (beyond the timespan of the plan), so they cannot learn
- Building a social network (process) takes time and repeated efforts
- → Social networks should be an initial condition and a static parameter for MATSim's goals
- Building social relationships is another model and should be done outside MATSim optimization loop

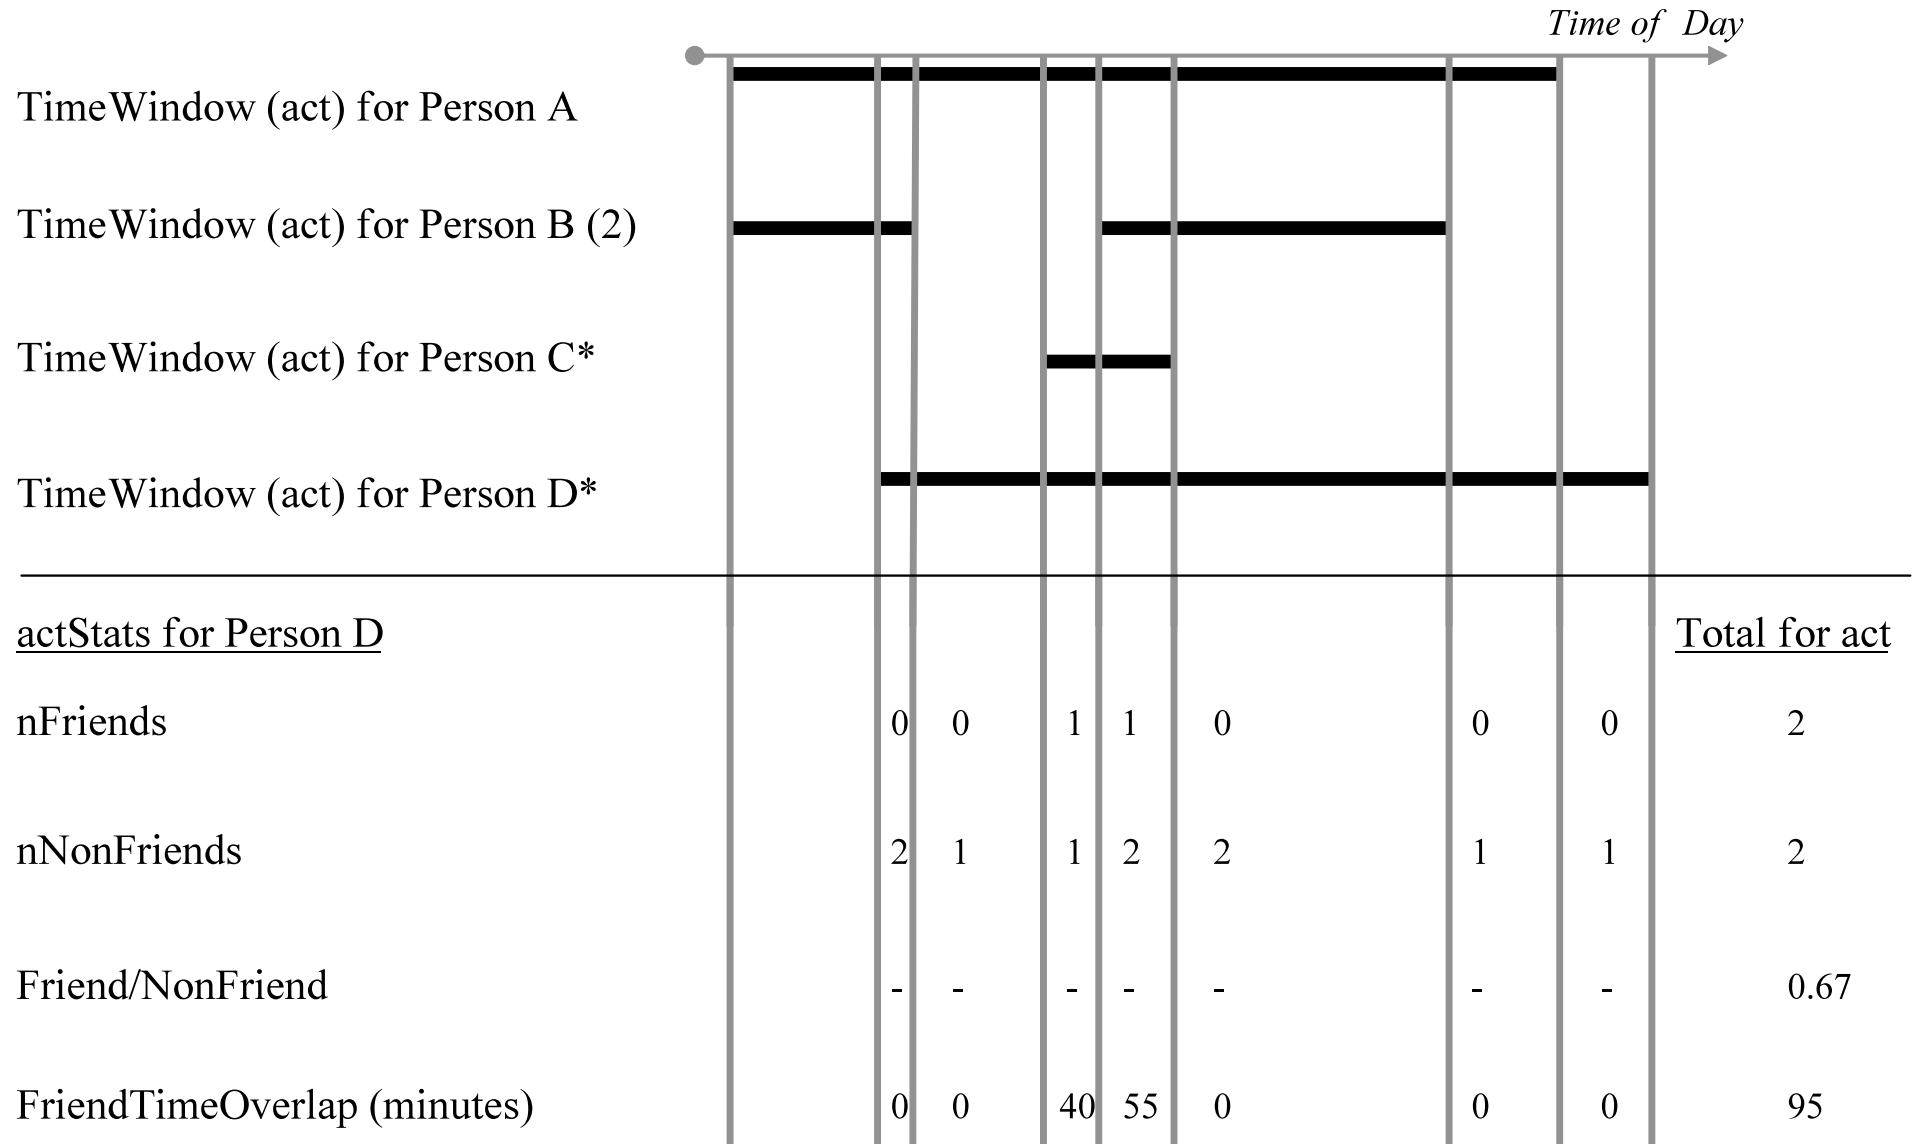

# Information Sharing

- Facilities (update Knowledge)
- Alters: introducing friends (EgoNet)
- Desired activity times and durations
- Other activity participants

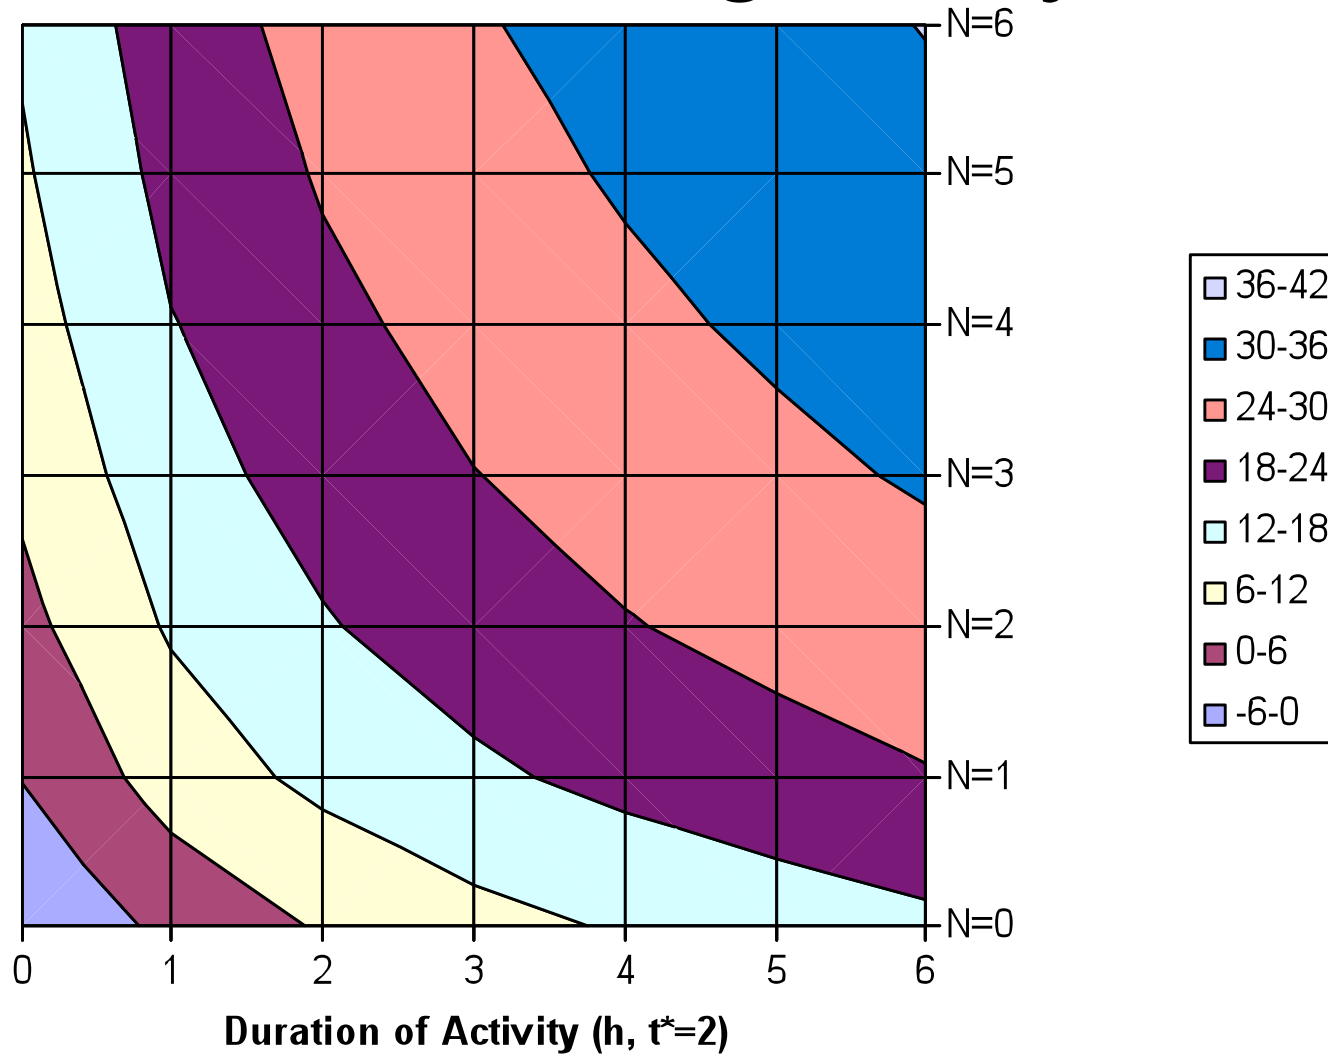

# Scoring

- Individual scoring of joint plan
  - $U = U_{std} + \beta_{1soc} * (\text{FriendFoeRatio} * \delta_{leisure})$
  - $U = U_{std} + \beta_{2soc} * (\text{Nfriends} * \delta_{leisure})$
  - $U = U_{std} + \beta_{3soc} * (\ln(\text{Nfriends} + 1) * \delta_{leisure})$
  - $U = U_{std} + \beta_{4soc} * (\ln(\text{TotalTimeWithFriends}(\text{hr})) * \delta_{leisure})$

# Socializing Utility

# Replanning

- Facility replanning
  - New facility from Knowledge
    - (Reroute, clear score)
- Joint time replanning
  - Activity start time set to group average
    - (Reschedule other acts, reroute, clear score)

# Truly Joint Plans

- Joint intent (plans)
  - Activity start time
  - Activity duration
  - Others there
  - Cost sharing
- Joint evolution?
  - Joint plan collapses if culling individual plans
  - Replaced with another joint plan
  - Intent cannot be maintained → "working point"

# Truly Joint Plans

*Plan1 of Agent2 is replanned and Plan1 of Agent1 is not.  
The joint utility valuation is lower for both.*

# Existing Social Networks Objects

- Social network
- Ego net
- Mental Map
- Spatial Interactor
- Non-spatial Interactor
- Replanning
- Scoring
- Statistics

# Desirable Social Network Objects

- Joint plans
  1. "AppointmentBook"
  2. "SocialAct"
    - Desired activity start time
    - Desired activity duration
  3. Joint plan evolution
    - Maintain agents in lock-step
